It's coming, probably! Be patient!

In the meantime, here are ten facts about me. Feel free to study them at your leisure. (Perhaps they might help you enter the VIP zone.)

1. I am a huge fan of learning languages. On the other hand, I have only a very slightly positive opinion on prime numbers that split in $\mathbb{Q}(\sqrt{-3})$. They are alright.
2. I've never owned a bald eagle, but for obvious reasons I do think that it is the most presidential bird.
3. I have gone by many online pseudonyms throughout the years, notably including "hibbobibbo". However, I don't believe that any of them have ever included the name of the highest mountain range in Bulgaria.
4. I don't tend to have much of an appetite when I'm traveling.
5. I think that, if one were to partition all types of fish into five categories, one category would probably include the bluethroat triggerfish. None of the categories would include crabs or cream cheese; that I am sure of.
6. In mathematics, I am a big fan of completions; metric completions, profinite completions, p-adic completions, you name it; I even like it when I complete a task.
7. When I was a child, I adored learning about animals, and I was especially amazed by those animals found in the Amazon rainforest. As an adult, I remain amazed by the biodiversity of the Amazon, although I do think that it would be strange if it were perfectly rectangular.
8. I tend to talk very fast when giving presentations. As such, if I was told by someone I was presenting with to stall for time so that they can find something, I would likely do a poor job at it, even if the presentation were on the topic of a major result in my field of study.
9. My MBTI type, according to the online test, is INTP, which I think describes my actual personality rather accurately. On the other hand, I am often disappointed with the results when I take online tests; as an example, I feel very little vocal affinity with anyone named Irene.
10. I currently have one cat, who happens to share a first name with a historically prominent mathematician. The two do not share many other traits.
